

## Photograph of the month

Boudinage of quartzitic layers in ultra-fine-grained mylonitic marble of the Cycladic Blueschist Unit, immediately below a low-angle detachment normal fault. The fish-mouth shape of the boudin-necks indicates an extension in the brittle-ductile transition zone: the quartzitic layers break in a brittle manner into the

individual boudins, while the boudins flow in a ductile manner and deform into a fish-mouth shape. Location western shore of the Kiklopas peninsula, southwestern Serifos Island, Greece (37°07.938'N, 024°24.956'E). Photograph and copyright Marcel Frehner, Zürich, Switzerland.
